# DETERMINATION OF MONOCROTOPHOS IN PALM OIL USING GEL PERMEATION CHROMATOGRAPHY CLEAN-UP AND CAPILLARY GAS CHROMATOGRAPHY by: YEOH CHEE BENG and AINIE KUNTOM

MPOB INFORMATION SERIES • ISSN 1511-7871 • JUNE 2005

MPOB TT No. 295

### **SCOPE**

he test method prescribes the requirements for the determination of monocrotophos residue in oil matrix.

## **DEFINITION**

Monocrotophos is the common name for dimethyl(E)-1-methyl-2-(methylcarbomoyl) vinyl phosphate. It is a colourless, hygroscopic crystal with a melting point of 54°C-55°C, a boiling point of 125°C/0.0005 mmHg, vapour pressure of 0.29 mPa (20°C), density of 1.33 g ml<sup>-1</sup> (20°C) and solubility in water at 20°C is 1 kg kg<sup>-1</sup>. The structure is as shown in *Figure 1*.

Figure 1. Chemical structure of monocrotophos.

## **PRINCIPLE**

The pesticide residues are extracted from oil matrix and the extracted sample is separated from the co-extractives using gel permeation chromatography (GPC) (*Figure 2*). Fraction containing the analyte was collected, the solvent evaporated and injected into a gas chromatograph fitted with flame photometric detector (*Figure 3*).

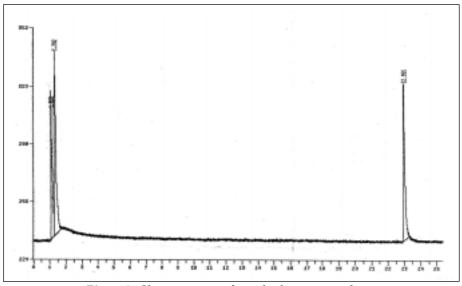

Figure 3. Chromatogram of standard monocrotophos.

ISSN 1511-7871

# **RECOVERY**

Recoveries of monocrotophos from spiked oil matrix at the range of 0.06-1.20  $\mu g$  g<sup>-1</sup> were 74.3%-101.6%.

Coefficient of variations for low concentrations were >10% and <10% at high concentrations.

Limit of detection was 4.0 µg kg<sup>-1</sup>.
